DETAILED ACTION

Drawings

The drawings are objected to under 37 CFR 1.83(a). The drawings must show every feature of the invention specified in the claims. Therefore, the openings in a solder resist layer must be shown or the feature(s) canceled from the claim(s). No new matter should be entered.

A proposed drawing correction or corrected drawings are required in reply to the Office action to avoid abandonment of the application. The objection to the drawings will not be held in abeyance.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claim 11,12 and 14-17 are rejected under 35 U.S.C. 102(e) as being anticipated by Nagai et al. (US 6,114,753).

Nagai (Fig 6-1) discloses a semiconductor device comprising a semiconductor chip (6.3) having a top and bottom surface, said semiconductor chip carrying a first electrode (6.7), a circuit substrate (6.1) attached to a top surface of said semiconductor

chip, said circuit substrate carrying thereon an inherent predetermined conductor pattern (via electrical contact of wire, 6.8) to inherent second and third electrodes (not labeled; where wire contact substrate), an inherent solder resist layer (6.4 & substrate comprising multiple inherent contiguous layer is of a solder resist material) on said circuit layer (6.4) that's either a glass epoxy or a polyimide (Col. 7, Lines 61-68), an adhesive epoxy resin layer (6.2; Col. 10, Line 13) intervening between said top surface of said semiconductor chip and said circuit substrate, a spherical electrode (6.5) formed in an inherent opening in said solder resist layer in correspondence to said third electrode, a bonding wire (6.8) electrically interconnecting said second electrode of said predetermined conductor pattern of said circuit substrate and said first electrode on said chip and a epoxy resin potting (6.4; Col. 9, Line 34) encapsulating the bond wires including said first and second electrodes, said chip and resin defined by a common edge surface when viewed in a direction substantially perpendicular to a principal surface and said substrate, wherein said resin layer has a composition substantially identical with a composition of said resin potting; and said chip having a sidewall substantially flush to an outer surface of said resin side wall cover with said side wall of said chip being substantially perpendicular to a principal surface of said chip.
